Treatment Summary

Patient:	Roger Davis
Treating provider:	Rachel Bell, DC
Diagnosis:	back strain

The patient presented following a motor vehicle collision involving a side impact at an intersection. Initial complaints included low back pain radiating into the left buttock, with associated muscular spasm and restricted lumbar range of motion. Neurological examination was unremarkable, with intact sensation, strength, and reflexes in both lower extremities. Imaging was not indicated at the initial visit given the absence of red flag findings.

Conservative management was initiated, consisting of manual therapy, targeted therapeutic exercise for core stabilization, modalities for pain control, and a home exercise program. Over the course of 13 visits, the patient demonstraetd gardual improvement in pain intensity and lumbar mobility. Functional limitations related to prolonged sitting and lifting decreased substantially by the final visits.

At discharge, the patient reported minimal residual discomfort with occasional flare-ups during prolonged activity. Lumbar range of motion was near normal, and the patient was independent with the home program. Continued self-directed exercise and activity modification were recommended, with follow-up as needed should symptoms recur.
