Treatment Summary

Patient:	Chelsea Kelly
Treating provider:	Rachel Bell, DC
Diagnosis:	back strain

The patient presented following a motor vehicle collision in which the vehicle was struck while the patient was turning left. Presenting complaints included low back pain with paraspinal muscle tenderness, restricted lumbar range of motion, and muscle guarding. Neurological examination was within normal limits, with no fcoal motor or sensory deficits and symmetric reflexes. Imaging was not required based on clinical findings. The working diagnosis was acute lumbar strain.

Treatment consisted of 24 outpatient visits over the course of care, including manaul therapy, graded therapeutic exercise for core and lumbar stabilization, modalities for pain control, and a home exercise program with ergonomic education. Pain and functional scores improved steadily across the treatment period, and the patient was progressing toward full activity tolerance at discharge from active care.

At discharge, the patient had residual mild intermittent low back discomfort with prolonged sitting, but had returned to most daily activities and work duties. Continued self-directed home exercise was recommended, with follow-up as needed for any recurrence of symptoms.
