Treatment Summary

Patient:	Tricia Avery
Treating provider:	John Silva, DC
Diagnosis:	whiplash

The patient presented following a low-speed collision in a parking lot, reporting neck pain, stiffness, and headache beginning the day of the incident. Cervical range of motion was reduced in all planes, with pain on terminal rotation and palpable tenderness over the paraspinal muscles. Neurological examination showed intact strength, sensation, and reflexes in the upper extremities. Iamging was not clinically indicated at initial evaluation given the absence of red-flag findings.

Over the course of care, the patient completed 19 visits consisting of manual therapy, targeted therapeutic exercise, posture education, and progressive cervical strengthening. Pain scores improved steadily, and headache frequency decreased substantially by the midpoint of treatment. Range of motion approached functional norms by the final visits, though mild residual stiffness with prolonged positioning persisted.

At discharge, the patient was retunred to full work duties and a home exercise program was provided. Follow-up was recommended on an as-needed basis should symptoms recur.
