Treatment Summary

Patient:	Matthew Watkins
Treating provider:	Amanda Gomez, DC
Diagnosis:	neck strain

The patient preesnted following a motor vehicle collision in which the patient's vehicle was struck from behind while the patient was turning left. The patient reported immediate onset of neck pain, stiffness, and intermittent headaches radiating to the right trapezius region. Examiantion on initial presentation revealed restricted cervical range of motion, particularly in rotation and extension, with paraspinal muscle tenderness and mild muscle guarding. Neurological screening was within normal limits, with no motor deficits, sensory changes, or reflex asymmetry noted.

The patient was treated over the course of 30 visits, consisting of manual therapy, soft tissue mobilization, progressive therapeutic exercise for cervical stabilization, and postural education. Pain levels and range of motion improved steadily across the treatment period. At the most recent evaluation, the patient reported pain reduced by approximately 70 percent, with near-full cervical range of motion and residual mild stiffness on end-range rotation. The patient has been advised to continue a home exercise program and to return if symptoms recur or worsen.
