Treatment Summary

Patient:	Justin Nelson
Treating provider:	Austin Hill, DC
Diagnosis:	back strain

The patient presented following a motor vehicle collision in which the vehicle was struck from behind while the patient was turning left. Reported symptoms included low back pain with radiation into the right paraspinal region, muscle guarding, and reduced lumbar rnage of motion, particularly with flexion and rotation. Neurological examination was within normal limits, with intact strength, sensation, and reflexes in both lower extremities. Imaging was not indicated at initial evaluation given the absence of red-flag findings. Diagnosis was acute lumbar strain wihtout evidence of radiculopathy. Treatment consisted of a structured course of ten outpatient physical therapy visits, including manual therapy, soft tissue mobilization, graded core stabilization exercises, and a home exercise program. The patient was also advised on activity modification and the use of over-the-counter anaglesics as needed. Progress was steady, with gradual improveemnt in pain intensity and functional tolerance for sitting, lifting, and prolonged standing. At discharge, lumbar range of motion was near baseline and the patient was independent with the home program. Prognosis for full recovery is good, with return to usual activities expected within several weeks.
