Treatment Summary

Patient:	Anthony Daniel
Treating provider:	John Silva, DC
Diagnosis:	concussion

The patient presented following a motor vehicle collision in which the patient's vehicle was sideswiped whlie changing lanes. The patient reported immediate headache, dizziness, light sensitivity, and difficulty concentrating. Neurological examination showed mild cognitive slowing and intermittent balance deficits, with no focal neurological deficits. Cervical strain was noted and assessed concurrently. Imaging was reviewed and did not demonstrate acute intracranial abnormality. The diagnosis was concussion with associated cervical strain.

Treatment consisted of a graduated return-to-activity protocol, vestibular and oculmootor rehabilitation exercises, cervical physical therapy, and cognitive rest recommendations. Over the course of 20 outpatient visits, the patient's symptoms improved steadily, with headache frequency and dizziness decreasnig and concentration tolerance returning to near baseline. Balance testing improved, and the patient progressed to full work and driving activities. At the most recent visit, residual mild neck stiffness persisted but the patient was functioning independently and was discharged from active care with a home exercise program and instructions to return if symptoms recur.
