Treatment Summary

Patient:	Ryan Palmer
Treating provider:	Tommy Griffin, DC
Diagnosis:	neck strain

The patient presented for evaluation following a rear-end motor vehicle colilsion and reported neck pain with stiffness, along with intermittent headaches radaiting to the base of the skull. Physical examination showed reduced crevical range of motion, particularly with rotation and extension, with paraspinal muscle tenderness and no focal neurological deficits. Cervical strain was diagnosed.

Over the course of care, the patient completed 18 visits consisting of manual therapy, soft tissue mobilization, therapeutic exercise for cervical stabilization, and postural education. Pain levels decreased steadily from the initial presentation, and range of motion improved in all planes by the final visit. Headache frequency also declined as neck mobility returned.

At discharge, the patient reported mild residual stiffness with prolonged computer use but was able to resume usual daily activities and work duties without restriction. A home exercise program was provided, and the patient was instructed to return if symptoms worsen or new neurological symptoms develop.
