## Treatment Summary

| | |
|---|---|
| **Patient:** | Kristi Moreno |
| **Treating provider:** | John Silva, DC |
| **Diagnosis:** | concussion |

Clinical Treatment Summary

Patient presented following a low-speed collision in a parking lot with reported head impact against the vehicle interior. Initial evaluation documented headache, dizziness, light sensitivity, and difficulty concentrating consistent with a concussion. Neurological screening showed mild balance deficits and reduced processing speed, with no focal deficits and no loss of consciousness reported.

Over the course of 18 office visits, care included graduated cognitive rest, a structured return-to-activity plan, vestibular exercises, and vision coordination therapy. Symptom scores improved steadily, with headache frequency and dizziness decreasing by roughly two-thirds by the final visit. Cognitive endurance returned to near baseline, and the pateint tolerated a full work schedule without relapse of symptoms.

Residual mild intermittent headaches with srceen use remain. The patient has been advised to continue home exercises, limit prolonged screen exposure, and report any recurrence of significant symptoms promptly. Referral to neurology is available if symptoms persist beyond the expected recovery window. Prognosis for full recovery is good.
