Treatment Summary

Patient:	Rebecca Spencer
Treating provider:	Nancy Mcgee, DC
Diagnosis:	back strain

The patient presented following a rear-end motor vehilce collision with complaints of low back pain radiating into the right buttock, paraspinal muscle tenderness, and reduced lumbar range of motion. Neurological examination revealed intact motor strength and sensation in both lower extremities, with negative straight leg raise bilaterally. Imaging was not indicated at initial evaluation given the absence of red flag findings. Diagnosis was acute lumbar strain with associated muscle spasm. Treatment consisted of a structured course of 25 visits over the recovery period, including manual therapy, therapeutic exercise focused on core stabilization and lumbar mobility, modalities for pain control, and a home exercise program with ergonomic counseling. Pain intensity and functional tolerance for sitting, lifting, and prolonged standing improved steadily across the course of care. At the most recent visit, the patient reported substantial symptom relief with only intermittent stiffness after prolonegd activity. Discharge to independent home exercise is recommended, with return evaluation if symptoms recur or new neurological signs develop.
