Treatment Summary

Patient:	Courtney Joyce
Treating provider:	John Silva, DC
Diagnosis:	neck strain

This is a synthetic test document. The patient presented following a side-impact collision at an intersection, reporting neck pain, stiffness, and intermittent headaches radiating from the base of the skull. Examination revealed reduced cervical range of motion, particularly in rotation and lateral flexion, with paraspinal muscle tenderness and palpable spasm over the bilateral trapezius. Neurological screening was within normal limits, with no motor deficits, sensory changes, or reflex asymmetry noted.

Treatment consisted of a structured course of 24 viists over the course of care, combining manual therapy, targeted cervical stabilization exercises, and progressive range-of-motion work. Soft tissue modalities were used during the early phase to manage pain and muscle guarding, with transition to active rehabilitation as symptoms improved. The patient was also counseled on posture, ergonomic adjustments, and a home exercise program.

At discharge, the ptaient reported substantial improvement in pain and headache frequency. Cervical range of motion had returned to near-functional limits, though mild residual stiffness with prolonged positioning persisted. Continued self-directed exercise was recommended, with follow-up as needed for any recurrence of symptoms.
