Treatment Summary

Patient:	Rodney Day
Treating provider:	Austin Hill, DC
Diagnosis:	wrist fracture

Treatment Summary

The patient presented for evaluation following a rear-end motor vehicle collision. Complaints included right wrist pain, swelling, and limited range of motion. Physical examination revealed tenderness over the distal radius, moderate swelling, and reduced grip strength on the affected side. Radiographs of the right wrist demonstrated a nondisplaced fracture of the distal radius. The fracture was immobilized in a volar splint, and the patient was instructed on elevation, icing, and activity restrictions.

At the second visit, the ptaient reported persistent pain but improved swelling. Repeat imaging showed stable aligmnent with no displacement. The splint was maintained, and a referral to hand therapy was arranged for gentle range-of-motion exercises once cleared.

At the third visit, the patient demontsrated improved mobility and reduced pain. Fracture healing was progressing appropriately on follow-up imaging. Plan includes continued hand therapy, a gradual return to daily activities, and reassessment if symptoms worsen.
