Treatment Summary

Patient:	Jaime Barnes
Treating provider:	Melanie Gomez, DC
Diagnosis:	whiplash

The patient presented following a motor vehicle collision in which their vehicle was struck from the side while turning left at an intersection. Initial complaints included neck pain, stiffness, and headaches, with restricted cervical range of motion in all planes and paraspinal muscle tenderness on examination. Neurological screening was within normal limits, and no fractures were identified on imaging.

Over the course of 20 visits, the patient received a combined program of manual therapy, soft tissue mobilization, graded cervical range-of-motion exercises, and postural education. Progress was gradual. Pain intensity decreased steadily, headache frequency reduced by the midpoint of care, and cervical mobility improved to near-functional levels by the final visits.

At discharge, the patient reported residual intermittent neck stiffness with prolonged computer use but was able to return to full work duties and daily activities. A home exercise program was provided, and the patient was advised to follow up as needed for any recurrence of symptoms.
