Treatment Summary

Patient:	Hannah Carter
Treating provider:	Michael Clark, DC
Diagnosis:	knee injury

The patient presented following a side-impact motor vehicle collision at an intersection, reporting rgiht knee pain, swelling, and difficulty bearing weight. Initial examination revealed effusion, tenderness along the medial joint line, and restricted range of motion with pain on valgus stress. Imaging was obtained to rule out fracture, and no acute bony abnormality was identified. Clinical findings were consistent with a soft tissue injury to the medial collateral ligament and meniscus, graded as a moderate sprain.

Over the course of seven visits, the patient received a structured program combining manual therapy, therapeutic exercise for quadriceps and hip strengthening, gait training, and modalities for pain and swelling control. Pain and effusion decreased steadily, and range of motion improved to near functional levels. Weight-bearing tolerance and stair negotiation improved with progression of exercise. At the most recent visit, the patient reported mild residual discomfort with prolonged standing and pivoting activities. Continued home exercise, activity modification, and a follow-up evaluation if symptoms persist are recommended.
