Treatment Summary

Patient:	Bradley Chavez
Treating provider:	Joseph Bradford, DC
Diagnosis:	wrist fracture

The patient presented following a rear-end motor vehicle collision with pain, swelling, and limited range of motion in the right wrist. Radiogrpahs confirmed a distal radius fracture with mild displacement, and the injury was managed with closed rdeuction followed by immobilization in a short-arm cast for six weeks. Serial imaging confirmed maintenance of alignment and progressive callus formation without loss of reduction.

Over the course of treatment the patient completed 25 visits, including orthopedic follow-up appointments, cast checks, and a structured physical therapy program focused on restoring grip strength, wrist flexion and extension, and forearm rotation. Pain was initially managed with scheduled analgesics and was gradually tapered as symptoms improved. Occupational therapy addressed fine motor tasks and return to daily activities.

At discharge from active care, the patient dmeonstrated near-full wrist range of motion with residual mild stiffness in extension and grip strength at approximately 85 percent of the uninjured side. Continued home exercise and periodic reassessment were recommended, with a full return to prior work duties anticipated over the following months.
