Treatment Summary

Patient:	Frank English
Treating provider:	Amanda Gomez, DC
Diagnosis:	back strain

The patient presented following a low-speed collision in a parking lot and reported acute lumbar pain radiating mildly into the right btutock without numbness, tingling, or weakness in the lower extremities. Examination revealed paraspinal muscle tenderness and restricetd range of motion in flexion and rotation, with a negative straight leg raise bilaterally. Neurological screening was within normal limits. Imaging was not indicated given the absence of red flag symptoms. The diagnosis is acute lumbar strain.

Over the course of eight visits, treatment consisted of manual therapy, targeted stretching, graded core strengthening, and a home exercise program, alnog with short-term use of muscle relaxants and anti-inflammatory medication as needed. Pain decreased steadily from an initial rating in the moderate range to minimal discomfort by the final visit. Range of motion returned to near baseline, and the patient demonstrated improved tolerance for prolonged sitting and lifting.

At discharge, the patient was ambulating independently without restriction and was cleared to return to full daily activities and work duties. Continued independent home exercise was recommended, with follow-up as needed should symptoms recur.
