Treatment Summary

Patient:	Natasha Chase
Treating provider:	Michael Clark, DC
Diagnosis:	back strain

Clinical Treatment Summary

The patient presented following a low-speed head-on motor vehicle collision with complaints of acute low back pain and stiffness radiating into the paraspinal musculature. Physical examination revealed localized tenderness over the lumbar paraspinal muscles, restricted range of motion in flexion and extension, and muscle guarding without neurological deficit. Imaging was not indicated based on clinical findings. Diagnosis was lumbar strain.

Over the course of 15 visits, the patient received a structured conservative care plan consisting of manual therapy, therapeutic exercise focused on core stabilization and posture, and modalities for pain control. Symptoms improved steadily, with reduced pain intensity, improved lumbar mobility, and return toward baseline daily activity. Home exercise instruction and ergonomic guidance were provided throughout the course of care.

At the most recent evaluation, the patient reported minimal residual discomfort with full functional return to work and daily activities. Discharge from active treatment was recommended with instructions to continue the home exercise program and return as needed for recurrecne of symptoms.
