Treatment Summary

Patient:	Kathryn Orozco
Treating provider:	Austin Hill, DC
Diagnosis:	shoulder injury

Clinical Treatment Summary

Patient presented for evaluation following a low-speed head-on motor vehicle collision. Reported right shoulder pain with restricted range of motion, particularly with overhead reaching and internal rotation. Pain rated moderate at initial visit. No loss of consciousness and no reported head injury.

Examination revealed tenderness over the right anterior shoulder, mild swelling, and painful active abduction beyond 90 degrees. Neurovasuclar status of the right upper extremity was intact. Imaging was obtained and showed no acute fracture or dislocation. Working diagnosis was right shoulder strain with rotator cuff irritation.

Treatment consisted of a sling for short-term comfort, prescribed anti-inflammatory medication, application of ice, and a home program of gentle pendulum and range-of-motion exercises. Activity modifications were discussed.

At the second visit, the patient reported partial ipmrovement in pain and was able to perform daily activities with moderate limitation. Range of motion had improved, though overhead reaching remained painful. Plan includes continued home exercises, a gradual return to activity as tolerated, and follow-up if symptoms persist.
