Treatment Summary

Patient:	Shannon Lopez
Treating provider:	Tommy Griffin, DC
Diagnosis:	concussion

Clinical Treatment Summary

Patient presented following a low-speed head-on motor vehicle collision with reoprted immediate headache, dizziness, and brief disorientation at the scene. No loss of consciousness was reported. Neurological examination on initial evaluation showed mild balance impairment and intermittent light sensitivity, with cranial nerve, motor, and sensory findings otherwise within normal limits. Cognitive screening revealed mild deficits in attention and processing speed.

Over the course of 30 scheduled visits, care included graded symptom monitoring, vesitbular and balance exercises, cervical physical therapy, and cognitive rest protocols with gradual return to school and work activities. Headache frequency and dizziness decreased steadily across the treatment period, and repeat cognitive scerening sohwed improvement toward baseline.

At discharge, the patient reported minimal residual symptoms and was cleared for full activity with instructions to return for evaluation if symptoms recur. Ongoing self-management guidance was provided, including sleep hygiene, hydration, and avoidance of activities that worsen symptoms.
