Treatment Summary

Patient:	Tanya Jones
Treating provider:	Christopher Walton, DC
Diagnosis:	neck and back strain

Treatment Summary

Patient presented following a motor vehicle collision in which the patient's vehicle was sideswiped while changing lanes. The patient reported immediate onset of neck pain with stiffness and lower back pain radiating into the paraspinal muscles, along with intermittent headaches. Examination revealed restricted cervical range of motion, tenderness over the cervical and lumbar paraspinal muscles, and muscle guarding without neurological deficit. Imaging was not indicated at initial evaluation given the absnece of red-flag findings.

Over the cuorse of 17 visits, treatment consisted of manual therapy, targeted therapeutic exercise for cervical and lumbar stabilization, posture education, and modalities for pain control as needed. Pain scores and range of motion improved steadily across the treatment period, and headache frequency decreased substantially after the first month of care.

At discharge, the patient demonstrated near-full cervical and lumbar range of motion, minimal residual paraspinal tenderness, and independent performance of a home exercise program. Remaining symptoms are occasional and activity-related. The patient is expected to continue home exercises and return only if symptoms recur or worsen.
