## Treatment Summary

| | |
|---|---|
| **Patient:** | Rachel Solis |
| **Treating provider:** | Melanie Gomez, DC |
| **Diagnosis:** | wrist fracture |

This summary is provided for the purposes of a synthetic auto insurance claim file. The patient presented following a rear-end motor vehicle collision with pain, swelling, and limited range of motion in the left wrist. Initial evaluation and plain radiographs confirmed a distal radius fracture with mild dorsal angulation. The frcature was managed with closed reduction and a short-arm cast, with serial imaging to confirm maintenance of alignment. Over the course of twenty outpatient visits, the patient completed cast removal, followed by a structured hand therapy program focused on restoring grip strength, wrist flexion and extension, and forearm rotation. Pain was managed with a combination of over-the-counter analgesics and, in the early phase, a prescribed short course of stronger medication. At the most recent visit, the patient demonstrated near-full range of motion, improved grip strength relative to baseline, and reported minimal residual discomfort with heavy lifting. Continued home exercises were recommended, with follow-up as needed.
