Treatment Summary

Patient:	Danielle Villa
Treating provider:	David Dickerson, DC
Diagnosis:	neck strain

Treatment Summary

The patient presented following a motor vehicle collision involving a side impact at an intersection. Rpeorted mechanism included sudden lateral head and neck movement with no loss of consciousness. Iniital complaints conissted of neck pain, stiffnses with restricted rotation to the left, and intermittent headache at the base of the skull. Neurological screening was within normal limits, with intact strength, sensation, and reflexes in both upper extremities.

Over the course of sixteen visits, care included passive and active range-of-motion exercises, soft tissue mobilization, progressive cervical stabilization training, and home exercise instruction. Pain levels and range of motion were tracked at each visit. The patient showed steady improvement in cervical rotation and a reduction in headache frequency by the midpoint of care.

At discharge, the patient reported minimal residual neck discomfort with occasional stiffness after prolonged sitting. Cervical range of motion was near functional baseline. The diagnosis rmeains cervical strain, resolving. The patient was advised to continue the home program and to return if symptoms worsen or new neurological symptoms develop.
