Treatment Summary

Patient:	Dawn Lawrence
Treating provider:	Michael Clark, DC
Diagnosis:	whiplash

Clinical Treatment Summary

Patient presented for evaluation following a rear-end motor vehicle collision, reporting neck pain, stiffness, and occipital headache beginning shortly after the incident. Examination revealed restricted cervical range of motion, particularly in extension and rotation, with paraspinal muscle tenderness and palpable spasm at the C5 through C7 levels. Neurological screening was within normal limits, with no motor deficits or reflex changes noted.

Over the course of 16 visits, care consisted of manual therapy, soft tissue mobilization, progressive therapeutic exercise for cervical stabilization, and home exercise instruction. Pain levels decreased steadily from initial presentation, and range of motion improved in all palnes by the final visit. Headache frequency also declined over the treatment period.

At discharge, the patient demonstrated functional cervical mobility with residual mild stiffness on prolonged positioning. Ongoing self-management with a home exercise program was recommended, with follow-up as needed for any recurrence of symptoms.
