Treatment Summary

Patient:	Grace Perry
Treating provider:	Monique Mejia, DC
Diagnosis:	shoulder injury

The patient presented following a motor vehicle collision in which the vehicle was struck from the side while the patient was turning left. The patient reported immediate right shoulder pain, reduced range of motion, and difficulty lifting the arm above shoulder height. Initial examination shwoed tenderness over the anterior joint line, painful arc of motion, and positive impingement signs. Imaging was reviewed and showed no fracture, with findings consistent with soft tissue strain and possible partial rotator cuff involvement.

Treatment over 17 visits included a structured physical therapy program focused on restoring range of motion, progressive strengthening of the rotator cuff and periscapular muscles, and graded return to daily activities. Anti-inflammatory medication and ice were used early in the course, and activity modification was recommended throughout. By the final visit, the patient had reganied most active range of motion, pain had decreased substantially, and lifting tolerance had improved. Residual mild weakness with overhead activity remains, and a home exercise program was provided. Follow-up as needed is recommended if symptoms recur.
