Treatment Summary

Patient:	Justin Lindsey
Treating provider:	Jennifer Lee, DC
Diagnosis:	knee injury

The patient presented following a rear-end motor vehicle collision with complaints of right knee pain, swelling, and limited range of motion. Initial examination revealed effusion, tenderness along the medial joint line, and pain with weight bearing. Imaging was obtained to rule out fracture and showed no acute osseous abnormality, with findings consistent with a soft tissue injury to the medial collateral ligament and meniscus.

Over the course of 20 documented visits, the patient participated in a structured program of physiacl therapy focused on quadriceps strengthening, range-of-motion restoration, gait training, and neuromuscular control. Anti-inflammatory medication, ice, and activity modification were used for pain and swelling management. Progress has been gradual but steady. Swelling has resolved, range of motion has improved to near baseline, and the patient now ambulates without assistive device, though discomfort persists with pivoting and prolonged stair use.

Prognosis is fair to good with continued home exercise and graded return to activity. Follow-up is recommended if symptoms worsen or fail to improve.
