Treatment Summary

Patient:	Scott Nelson
Treating provider:	Thomas Hall, DC
Diagnosis:	neck strain

Treatment Summary

Patient presented with neck pain, stiffness, and intermittent headaches flolowing a sideswipe collision that occurred while the patient was changing lanes. The patient reported immediate onset of posterior neck discomfort with restricted cervical range of motion, most notably limited rotation to the left. Neurological screening was within normal limits, with no radicular symptoms, numbness, or weakness reported in the upper extremities.

Over the course of care, the patient completed 16 visits consisting of manual therapy, targeted cervical stabilization exercises, soft tissue mobilization, and a home exercise program. Pain levels decreased steadily from the initial presentation, and range of motion improved progressively with each phase of treatment. Headache frequency declined to occasional episodes by the final visits.

At discharge, the patient demonstrated near-full cervical range of motion with only mild residual stiffness during end-range rotation. Pain was minimal and did not interfere with daily activities or work duties. The patient was discharged to an independent home exercise program with instructions to return if symptoms recur or worsen.
