Treatment Summary

Patient:	Lisa Reynolds
Treating provider:	Tommy Griffin, DC
Diagnosis:	back strain

The patient presented folloiwng a low-speed collision in a parking lot with complaints of acute low back pain and stiffness radiating into the right paraspinal region. Examination revealed paraspinal muscle tenderness and limited lumbar range of motion, particularly with flexion and rotation. Neurological screening was within normal limits, with intact motor strength, sensation, and reflexes in both lwoer extremities. No signs of fracture or radiculopathy were identified, and imgaing was not indicated based on clinical findings.

Over the course of seven visits, the patient received a structured program consisting of manual therapy, guided therapeutic exercise, and instruction in posture and activity modification. Pain levels decreased steadily from the initial presentation, and range of motion improved progressively with each session. Home exercise instructions were reinforced at each visit, and the patient demonstrated good adherence.

At discharge, the patient reported minimal residual discomfort with daily activities and had returned to full work duties. Lumbar mobility was near baseline. The diagnosis remains lumbar strain, resolving. Follow-up care is available as needed should symptoms recur.
