September 2024: chiropractic adjustment, massage therapy	4	$430.48

Treatment summary

Treatment Summary

The patient presented following a low-speed collision in a parking lot and reported neck and back pain. The described mechanism of injury is consistent in type and force with the strain pattern identified on examination. Imaging and physical findings clearly support the diagnosis of cervical and lumbar strain. The patient has no konwn prior injury to the neck or back. Over the cousre of 18 visits, care included manual therapy, guided exercise, and home stretching. Symptoms improved steadily, and the frequency of visits was reduced as function returned, consistent with a typical recovery course. At the most recent evaluation, range of motion had nearly returned to baseline and residual discomfort was limited to occasional stiffness with proolnged sitting. Billing records include two similar charges posted on the same day, which are under rouitne review. Continued home exercise and as-needed follow-up are recommended.
