March 2024: chiropractic adjustment, physical therapy	4	$536.45
April 2024: imaging, massage therapy, pain management	4	$2,489.48

Treatment summary

Clinical Treatment Summary

The patient was struck by another vehicle while turning left, a mechanism consistent with the wrist fracture diagnosed at the initial evaluation. The fracture was immobilized and the patient was later referred for hand therapy. Over the course of care, the patient attended 28 visits, many of them on nearly consecutive days. Several weeks after the collision, complaints involving additional body regions were added to the treatment plan, though no clear connection to the original mechanism was documented at that time. Follow-up imaging showed the fracture in acceptable alignment, and repeated physical examinations were within normal limits. Most current complaints rest on the patient's self-reported pain, which the examinations did not objectively confirm. The records show no prior injury to the same area. Billing records contain no repeated charges for the same services.
