December 2024: imaging, massage therapy, pain management, physical therapy	6	$2,754.51
January 2025: chiropractic adjustment, imaging, massage therapy, pain management,	6	$1,595.66

Treatment summary

Patient presented following a collision in which the vehicle was struck while making a left turn. The reported mechanism is consistent with the knee injury described, and the force involved is in keeping with the structures affected. Care was delivered over 29 visits, beginning with conservative management including physical therapy, activity modification, and anti-inflammatory medication. Progress was steady, and visit frequency was reduced in a stepwise fashion as symptoms and range of motion improved. On examination, some findings, including effusion and pain with specific loading maneuvers, support the presence of an injury to the knee. Other provocative tests and neurovascular assessments were within normal limits. Records note a remote, minor strain involving the same region from several years ago, which had resolved completely without lasting limitation. Billing records reflect single entries for each service without duplicate or repeated charges. The patient was discharged to self-directed home exercise with instructions to return if symptoms recur.
