April 2024: chiropractic adjustment, massage therapy, pain management	4	$636.09
May 2024: imaging	1	$833.86

Treatment summary

Treatment Summary

The patient presented following a low-speed collision in a parking lot with complaints of headache, dizziness, and cognitive fatigue consistent with concussion. The mechanism of injury and the force of the impact are considered well matched to the reported symptoms. Over the course of 21 visits, care included neurological assessment, vestibular and balance evaluation, graded symptom monitoring, and graduated return-to-activity guidance. Several examination findings, including mild balance deficits and reduced tolerance to visual tracking tasks, support the diagnosis, while other standard neurological tests, such as cranial nerve function, strength, and reflexes, returned normal. No piror injury to the head or neck region is known. Treatment followed an expected clinical course, with visit frequency and itnensity tapering as symptoms improved and function returned. Billing records reflect single, appropriate charges for each service rendered without duplication. Ongoing follow-up is recommended only if symptoms recur.
