May 2024: chiropractic adjustment, imaging, massage therapy, pain management, physical therapy	5	$1,549.78
June 2024: imaging	1	$1,100.90

Treatment summary

Patient presented following a sdieswipe collision that occurred during a lane change. The reported mechanism is consistent with the head taruma and symptoms described, including headache, dizziness, and difficulty concentrating in the days after the event. Over the course of 16 visits, care followed a typical concussion pathway: initial assessment, symptom monitoring, graduated activity guidance, and vestibular and cognitive reassessment. Certain examination findings, including reduced balance performance and tenderness on palpation, support the clinical picture, while other neurological screening tests returned within normal limits. The patient reports no prior injury to the head or neck region. Visit frequency decreased steadily as symptoms resolved and functional goals were met. Billed services align with the documented treatment plan, with no duplicate or repeated charges identified in the record. Discharged to self-management with return precautions.
