March 2024: chiropractic adjustment, pain management	7	$1,834.45
April 2024: imaging, massage therapy, pain management	5	$2,623.70

Treatment summary

Patient presented following a motor veihcle collision in which their vehicle was struck while turning left, reporting right knee pain at the time of evaluation. The mechanism and force of the impact are consistent with the reported knee injury. No prior injury to this body area is known to this provider. Over the course of care, the patient attended 25 visits for conservative management, including physical therapy, activity modification, and anti-inflammatory medication. Treatment followed a typical progression and was gradually reduced in frequency as symptoms improved. Subjective pain complaints form the basis of most documented findings, as the patient's report of pain is the primary indicator in this record. Imaging of the knee and standard orthopedic examination maneuvers returned normal results. Billed services reflect the treatment provided, with no repeated or duplicate charges identified. Discharge from active care is anticipated pending continued home exercise and follow-up as needed.
