August 2023: chiropractic adjustment, imaging, pain management, physical therapy	4	$2,057.68
September 2023: imaging, pain management	2	$978.69

Treatment summary

Patient presented following a motor vehicle collisoin in which the patient's vehicle was struck while turning left. The reported mechanism is consistent with the injury diagnosed, which is a concussion with post-traumatic headache and intermittent dizziness. Over the course of sixteen visits, care consisted of graded symptom management, vestibular and oculomotor exercises, cervical physical therapy, and periodic neurologic reassessment. Treatment followed a typical progression, with visit frequency decreasing as symptoms improved and the patient was gradually discharged from active therapy. Examination findings include reduced tolerance to visual tracking and mild balance deficits on tandem testing, which support the clinical diagnosis. Other components of the neurologic examination, including cranial nerve function, strength, sensation, and coordination, were within normal limits. No prior injury to the cervical spine or head is documented in the available history. Billing records reflect single charges for each service rendered, with no duplicate or repeated billing observed. Current status is improving, and the patient is expected to reach maximum medical improvement with continued home eexrcise and symptom monitoring.
