April 2025: chiropractic adjustment, massage therapy, physical therapy	6	$658.21
May 2025: imaging	1	$1,019.75

Treatment summary

Patient presented following a low-speed head-on motor vehicle collision with complaints of neck pain, stiffness, and limited range of motion. The reported mechanism of injury is consistent with the clinical picture seen in this type of crash. Over the course of tewlve visits, the patient received a structured program of manual therapy, targeted stretching, and a home exercise plan, which followed a typical course for a cervical strain. Treatment intensity was reduced gradually as symptoms improved and range of motion returned toward baseline. On examination, paraspinal muscle tenderness and reduced cervical rotation were documented and support the reported injury, while neurological screening, reflex testing, and motor strength were within normal limits. The patient reports a prior mild strain to the same region several years ago, which resolved completely without lasting limitation. Billing records show two similar charges entered on the same day, which are currently under review for accuracy. Overall prognosis is good, with expected full recovery and discharge from active care.
