August 2024: chiropractic adjustment, imaging, physical therapy	4	$1,472.64

Treatment summary

Treatment summary, cervical region. The patient presented following a rear-end motor vehicle collision with complaints of neck pain, stiffness, and headaches. The reported mechanism and force of impact are consistent with the cervical injury diagnosed. Examination revealed reduced range of motion and paraspinal muscle tenderness, which support the diagnosis. Neurological screening, reflexes, and imaging were within normal limits. No prior injury or treatment to the cervical spine is known. Care has included 37 visits to date. Over time, the frequency and scope of services expanded beyond what is typically expected for this injury, with additional modalities added in later months. Billing records were reviewed and show no duplicate charges for the same services. Ongoing care and the expected duration of treatment will be reassessed at the next scheduled review.
