| May 2025: imaging, pain management, physical therapy | 4 | $2,075.60 |
| June 2025: physical therapy | 2 | $297.64 |

### Treatment summary

Patient presented following a rear-end motor vehicle collision with complaints of neck pain, stiffness, and headache radiating into the upper shoulders. The reported mechanism of injury is consistent with the force and direction of the impact, and the presenting symptoms are in keeping with a cervical strain pattern. No prior injury to the cervical spine or upper back is known from the history obtained. Conservative management was provided over 28 visits, including manual therapy, therapeutic exercise, and home stretching instructions. Care extended somewhat beyond the typical course for this type of injury, with gradual improvement reported over time. Cervical range of motion, neurological screening, and palpation findings were largely within normal limits at each assessment, and cervical imaging showed no acute abnormality. Therefore, the clinical picture relies heavily on the patient's self-reported pain levels and functional limitations. Billing records reviewed for this episode reflect single, non-duplicated chagres for each service rendered.
