January 2024: massage therapy, pain management, physical therapy	5	$1,258.73

Treatment summary

Patient presented following a low-speed collision in a parking lot with acute pain and swelling of the right knee. The reported mechanism of injury is consistent with the kind and force of the impact observed. Imaging and physical examination findings clearly confirm the knee injury, and no prior injury to the same body region is known from the patient history. Care was delivered over 29 visits, wihch is somewhat longer than typically expected for this type of injury, with progression addressed through reassessment at each stage. Conservative management included physical therapy, activity modification, and anti-inflammatory medication, with gradual improvement in range of motion and strength. Billing records reviewed for the episode of care show no repeated charges for the same services. Ongoing follow-up and a home exercise program have been recommended, and the patient is expected to return to baseline activity with continued rehabilitation.
