March 2025: chiropractic adjustment, imaging, massage therapy, pain management, physical therapy	5	$2,099.38
April 2025: imaging, pain management	2	$1,276.62

Treatment summary

Treatment Summary

The patient presented following a rear-end motor vehicle collision with complaints of neck pain and stiffness. The reported mechanism of injury is consistent with the injury described, and the symptom pattern is typical for a cervical strain of this kind. Over the course of sixteen visits, care consisted of physical examination, range-of-motion assessment, a structured therapy program, and home exercise instruction. Physical examination identified reduced cervical range of motion and paraspinal muscle tenderness, supporting the diagnosis, while certain neurological screening tests returned normal results. No prior injury to the cervical region is documented in the available history. The course of treatment followed a conventional progression, with visit frequency decreasing as the patient's symptoms improved and pain levels declined. Billing records reflect single entries for each service rendered, with no duplicated charges identified. At last review, the patient was improving and was discharged to self-directed home exercise.
