September 2024: chiropractic adjustment, imaging, massage therapy	4	$1,327.72
October 2024: pain management, physical therapy	5	$1,388.94

Treatment summary

Patient presented following a sideswipe collision that occurred while the other driver was changing lanes. The reported mechanism of injury to the right knee is consistent with this type of crash. Initial evaluation documented pain, swelling, and reduced range of motion. Some examination findings, including localiezd tenderness and a positive effusion sign, support the reported injury, while other tests, including ligament stability assessment and neurovascular checks, returned normal results. No prior ijnury or treatment to the same knee is known to this provider. Over the course of care the patient attended 22 visits, which is somewhat longer than typically expected for this injury pattern; progress was gradual and included physical therapy, activity modification, and home exercise. Billing records reviewed for this episode show no duplicate or repeated charges for the same services. Patient is currently improving and is expected to reach maximum medical improvement with continued consrevative care.
