September 2024: chiropractic adjustment, massage therapy, pain management	4	$1,304.38
October 2024: pain management	1	$441.28

Treatment summary

Patient presented following a collision in which their vehicle was struck while turning left. Complaints centered on neck pain and stiffness consistent with cervical strain. The mechanism and force of the impact appear well matched to the injury described. Over the course of sixteen visits, care included manual therapy, range-of-motion exercises, and a home stretching program. Treatment followed a typical progression, with visit frequency and intensity reducing steadily as symptoms resolved and mobility returned. On examination, reduced cervical range of motion and paraspinal muscle tenderness support the reported injury, while neurological screening, reflexes, and strength testing were within normal limits. No prior injury to the cervical spine or surrounding soft tissues is known to this provider. Separately, the billing records show two similar charges entered on the same day, which are currently under review for accuracy. Based on current findings, the patient is expected to reach full recovery with continued home exercise and periodic reassessment as needed.
