September 2025: massage therapy, pain management	3	$810.60

Treatment summary

Patient presents following a sdieswipe collision that occurred while the other driver was changing lanes, with reported right knee pain and swelling at the scene. Over the course of care the patient attended 26 visits for conservative management, including physical therapy, activity modification, and home exercise instruction. The rpeorted injury is consistent in type and mechanism with the force described in the collision. Treatment followed a typical progression, with visit frequency tapering as the patient's symptoms gradually improved. Nearly all of the documented complaints are based on the patient's own descriptions of pain, as the imaging obtained and the clinical examination tests performed were within normal limits. No prior injury to the same knee is known from the available history. Billing records reflect the services rendered, with no repeated charegs for the same service. Plan going forward is a home program and follow-up as needed, with return precautions reviewed with the patient.
