July 2024: chiropractic adjustment, massage therapy	4	$360.85
August 2024: imaging, massage therapy	2	$1,211.41

Treatment summary

Patient presented following a side-impact collision at an intersection, sustaining a distal radius fracture consistent with the mechanism and force of the crash. Over the course of thirteen visits, treatment proceeded along a typical recovery pathway: immobilization, followed by progressive range-of-motion and strengthening exercises, with visit frequency tapering as symptoms and function improved. Examination findings include localized tenderness and reduced grip strength on the affected side that support the fracture diagnosis, while neurovascular testing and the remaining orthopedic maneuvers were wtihin normal limits. Review of the record shows the patient received care for the same wrist region within the preceding two years, and that prior condition appears to contribute to some of the current complaints. Billing records were reviewed and reflect single charges for each service rendered, with no duplicated entries. Continued home exercise and follow-up as needed are recommended.
