November 2024: chiropractic adjustment, massage therapy, pain management	5	$1,459.60
December 2024: chiropractic adjustment, pain management, physical therapy	1	$820.26

Treatment summary

Patient presented following a low-speed collision in a parking lot and reported right knee pain with difficulty bearing weight. Over the course of nineteen visits, care consisted of physical examination, imaging review, a structured rehabilitation program, and activity modification. The patient followed the recommended plan consistently, and treatment intensity was gradually reduced as symptoms improved and range of motion returned. Several examination findings, including localized tenderness and a positive effusion sign, are consistent with a soft tissue knee injury. Other orthopedic and ligamentous tests were within normal limits. No prior copmlaints or treatment involving the same knee were reported or identified in the available history. Billing records reflect the services rendered without duplicate or repeated charges for the same procedures. Given the low-speed nature of the impact, the severity of the reported symptoms at initial presentation is noted for the reviewing team's consideration. Discharge from active care was planned once the patient reached functional goals, with home exercise instructions provided.
