| August 2025: massage therapy, pain management, physical therapy | 4 | $876.74 |

### Treatment summary

Clinical Treatment Summary

The patient presented following a low-speed collision in a parking lot and reported pain and swelling in the right knee. The mechanism of injury is consistent with the kind and force of the impact described. Over the course of sixteen visits, treatment followed a standard conservative pathway, including physical therapy, range-of-motion exercises, and anti-inflammatory medication. Symptoms improved steadily, and visit frequency was reduced as function returned.

Examination findings were mixed. Palpation produced localized tenderness and some effusion, which support the reported injury. Ligament stability testing and neurovascular checks were within normal limits. The patient's records also note a minor strain to the same area several years earlier, which resolved fully without lsating limitation.

Billing review identified one service entered twice for the same day. The treating provider confirmed that the second entry was a duplicate and not a separate encounter.
