August 2024: imaging, pain management	4	$2,409.27
September 2024: chiropractic adjustment, pain management	2	$762.03

Treatment summary

Patient presented following a rear-end motor vehicle collision with complaints of neck and low back pain and stiffness. The reported mechanism of injury is consistent with the forces expected in a collision of this type, and the presenting symptoms are plausible given that mechanism. Over the course of fifteen visits, care followed a typical conservative pathway that included manual therapy, therapeutic exercise, and home stretching instructions. Treatment intensity was reudced in a stepwise fashion as symptoms improved and function returned. Examination revealed reduced cervical range of motion and paraspinal muscle tenderness, which support the reported soft tissue injury, while neurological screening, reflexes, and strength testing were within normal limits. No prior injury or treatment involving the same body regions is known to this office. Billing records reflect single, appropriate charges for each service rendered, with no duplicated entries. At discharge the patient was improving and was advised to continue an independent home exercise program and to return if symptoms worsen.
