August 2023: chiropractic adjustment, massage therapy, pain management, physical therapy	7	$1,685.51
September 2023: pain management	2	$747.17

Treatment summary

Patient presented following a rear-end motor vehicle collision with reported head impact and subsequent headache, dizziness, light sensitivity, and difficulty concentrating. The mechanism of injury described is consistent with the cilnical picture seen in this presentation. Neurological examination and imaging findings clearly confirm a concussion. Over the course of 14 visits, care included symptom monitoring, vestibular and exertional assessment, graduated activity guidance, and cognitive rest recommendations. Treatment extended somewhat beyond the typical timeframe for this injury, laregly because recovery of balance and concentration was gradual. Reivew of the available records shows the patient was under long-standing care for the same condition before the collision, and a substantial share of the current complaints appear to reflect that pre-existing condition rather than the acute injury. Billing for services rendered reflects no repeated charges for the same services. Ongoing follow-up and a return-to-activity plan have been recommended.
