August 2024: imaging, massage therapy, physical therapy	6	$1,320.68
September 2024: pain management	1	$479.96

Treatment summary

Patient presented following a low-speed collision in a parking lot with ongoing right knee pain, swelling, and reduced range of motion. Over the course of care, the patient completed 41 visits consisting of physical therapy, home exercise instruction, and periodic clinical reassessment. Treatment followed a typical progression, with sessions gradually reduced in frequency as pain decreased and funciton improved. Several examination findings are consisetnt with a soft tissue knee injury, including localized tenderness and mild effusion, while other orthopedic and neurovascular tests remained within normal limits. The patient reports a remote, minor strain involving the same region several years ago, which resolved completely without lasting limitation. At this time, it is not yet clear whether the current symptoms are wholly attributable to the collision. Certain billing entries from a single date of service are under administrative review. Ongoing follow-up will determine the final causal relationship and functional outcome.
