August 2024: massage therapy, pain management, physical therapy	4	$956.93

Treatment summary

Patient presented following a motor vehicle collision in which the patient's vehicle was struck while turning left. The reported mechanism of injury is consistent with the kind and force of the impact, and the presenting shoulder complaints fit that history. Imaging and physical examination findings clearly confirm the shoulder injury. No prior injury to the same body area is known to this provider. Care was delivered over 28 visits and followed a typical course of rehabilitation, with visit frequency tapering as the patient's range of motion, strength, and pain improved. Billed services correspond to the treatment rendered, with no repeated charges identified. The patient was discharged from active care with a fvaorable functional outcome and was advised to continue a home exercise program and to return if symptoms recur.
