November 2023: imaging, pain management, physical therapy	3	$1,717.48
December 2023: massage therapy, pain management, physical therapy	4	$890.63

Treatment summary

Patient presented following a rear-end motor vehicle collision with reported head impact and subsequent symptoms consistent with concussion. The mechanism and force of the collision are well matched to the injury described. Over the course of 25 visits, the patient received a structuerd program of symptom monitoring, cognitive rest guidance, vestibular and oculomotor exercises, and gradual return-to-activity planning. Treatment followed a typical clinical progression, with visit frequency and intensity tapering as symptoms improved. Examination findings were mixed: several measures, including balance and eye-tracking assessments, supported the diagnosis, while other neurological screening tests returned normal results. No prior injury to the head or neck region is known to this provider. Billing records show two similar service charges on the same date of service, which are currently under routine review. Patient is discharged to self-directed home exericse with instructions to return if symptoms recur or worsen.
