August 2024: imaging, massage therapy, pain management, physical therapy	4	$1,980.63
September 2024: chiropractic adjustment, imaging	3	$870.85

Treatment summary

Patient presented following a low-speed head-on collision with a wrist fracture, and the reported injury is consistent with the mechanism and force of the crash. Initial imaging confirmed the fracture, and the patient was immobilized and then transitioned to a structured rehabilitation plan. Over the course of thirteen visits, treatment extended somewhat beyond the typical timeframe for this injury, reflecting a slower-than-expected return to function. Examination findings include localized tenderness and reduced grip strength on the affected side that support the diagnosis, while several other tests, including neurovascular assessment and sensation, returned normal. No prior injury to the same area is known from the patient history. Billing records reflect single, non-duplicated charges for each service rendered. Ongoing monitoring continues, with restrictions on heavy lifting maintained until radiographic and functional healing is confirmed.
